

For people like me who do not have much time to spend, having to manage the overlapping of more races is a great difficulty that requires a very heavy effort.

For this reason, I have a great admiration for the top Solers that can handle many races at the same time (I saw someone leading in four or five !!!).

So, BRAVO! to rumskib, karriv, rafa, java, the Franci and many others ... who devote themselves to this wonderful game!

To analyse this long race fifteen days, much longer than the ten days planned in the calendar, it's not very difficult.

Because there were many marks, needed to follow the gray whales, it meant that there were not many choices.

Ones who soon went leading the race have been favoured by the wind, which prevented the others to join them.

So from the outset the fight was held *de facto* among the Top 5 or 6, and those who won made fewer mistakes.

I do not use any router, I run my calculations only with pen and paper and the help of some tools (Aaron's Optimum angle, hmm's boat-predictor, the tool of a Russian, cannot remember the name, for the analysis of polars, and various other stuff like twac ...), but this time I did not make the mistakes that inevitably I make in each race, and then

BOOM ... 3rd !!!

I am very happy!

Bravo! to the podium, rumskib karriv Matoto (that's me!), and VWD to Top 10 and all.

See you at the next race, Arrivederci!

Matoto / October 2014
